

Game Health Restoration and Pacing

This research paper was conducted within the context of "Kenospic After Wars," a game developed solely by the author. The purpose of this study is to systematically analyse the various health restoration methods implemented in the game and to evaluate their effects on overall gameplay pacing.

Game Health and Restoration

Kenospic After Wars like most FPS games will contain a health that features a regenerative system, like most. [not yet implemented|[regeneration](#)] games.

This document will entail onto how I would wish to implement the health system, the regenerative counterpart and how it will effect the pace of PVP.

For this however, we must first exclude out our PVP and its target feel as an isolated experience and break it down. The PVP of Kenospic will feature raw combat without skill based matchmaking. This will ensure an exposed and vulnerable experience in PVP, allowing players to combat other players with exponentially varying skills. I am for this style of PVP just because I believe it is true to nature and authentic, real war doesn't let you select your opponent.

Kenospic will not be a realistic experience, it will be an authentic one. PVP will feel true to the game and will follow to carry a feel that will compliment the absolute art direction and how characters are portrayed.

Characters in Kenospic will feel heavy and tanky but also be allowed the freedom for omnidirectional movement with sliding that contradicts the very idea of weight, however we will keep it for now.

however we don't want players to camp as it slows the game down, if there are 5 players in a match made for 30 players, supposing my game is already dead and 1 of those is just camping one spot prone then it lowkey ruins the fun and also just excludes that player from the counting.

Players not being allowed to prone also keeps them up and visible, this allows for the loop of surviving and dying keep going on, atleast be more likely.

NOW THAT'S FOR THE PVP..

Game Health

Character health is regenerative and should we have a health bar hmmmmmm? I don't know.

we will also have to guess when the character has gotten out of combat to actually regenerate their health and not keep it always regenerating.

I personally love the system implemented by battlefield 1.

going with the idea that after 8-12 seconds of being out of combat, the character is allowed to regenerate and does so slowly regaining hp of 12 or 24 per second,

not allowing player to get the absolute view of their health and only giving them an idea of so using **HUD effects** and **heartbeat** sounds and pitching them to how critical their health is.

we must turn our focus on health regeneration.

Health Regeneration

Health regeneration methods actually have a huge impact on how the game is paced.

- Does the character have to stop to place a medical pack or a point of regeneration?
- Does the character have the ability to regenerate themselves, or only others or both?

- Does the character have the ability to heal themselves whilst shooting or combat
- Do only a certain group of players have the ability to regenerate if yes then what group and why them
- Do all players or the ones selected to be healers *of themselves or others* carry limited or unlimited heals?
- Does the very process of being regenerated slow the character down or ask static[[ness](#)].

After looking at all these questions we will be able to produce an interesting and complimenting health regeneration system that works in accordance to our PVP.

DOES THE CHARACTER HAVE TO STOP TO PLACE A MEDICAL POINT OR POINT OF REGENERATION.

Lets look at how other games do it.

Battlefield 1

Battlefield 1 allows players to throw smaller medpacks as they are running, directly to other players or on the ground for themselves, these medpacks help in little but effective healing allowing players being healed to keep moving and not having to stop.

It also features a med bag that allows for more healing, but at the cost of not being able to actively run, you must stay in area around the medbag to be healed but yes having much more effective healing.

this is a very cool 2 way healing method with either allowing the players to chose their own pros and cons, their target players *the ones being healed* to not.

RUST

Rust allows for medical syringes that heal you to a certain amount and allow for movement during so, it allows or players to instantly get some hp and have some regenerative space- if the character is bleeding then the player will lose that regenerative value or threshold which can only be stopped by bandaiding.

This forces players to use 2 different healing methods smartly during combat to heal and be able to give themselves a second chance, both allowing movement however.

Rainbow Six Siege

Rainbow Six actually features a much simpler regeneration system. There's one character allowed to do so with range and for self, where it conditions itself based on the effected[']s] health.

if the effected person has already got max health, they get a temporary buff of extra max

health, if lesser than max health then they regain some health, if downed however, they get revived.

this is pretty cool and neat and its limited. It also doesn't have any effect on actual movement.

World War 3

The game world war 3 features a rather more static system compared to the other examples, it lets players throw a bag on the ground in forward and creates a radius around it, the players have to stay in the radius to regenerate faster. it doesn't let a person full movement capabilities if they want to heal as they combat.

MilSim Games/Slow Games

Whilst id generally avoid taking example of games with different pacing than what I aim for, it is important to take their concept into account. Games with much slower pace or featuring realism are often slow, nutty and grutty with their healing process.

they often leave the actual medic vulnerable, taking a lot more time and having to go through a bar of progression to do anything effectively.

they also feature the complete stopping of movement to heal, movement cancels the movement progress made.

this effectively works to compliment the pace of the game, also forces players to only be able to heal in certain situations of sureness.

its just different and effectively different.
these revives often **feel** more rewarding and are rare.

Cherry picking time

Now we can literally take out our favourite parts of the above examples [considering they are our main inspiration for pacing in the project] and make our own healing system.

[we mustn't forget that the respective healing features are made in retrospect to compliment other features in the games, cherry picking without considering the feature that compliments the absolute system would be stupid]

[example: rust has a medical syringe that is perfectly complimented by the feature of being able to place a dynamic cover/wooden barricade, it allows for players to gain some cover before actually syringing themselves, whilst this idea seem like it doesn't do a lot but its how its used and we cannot ignore the absolute method players use]

Absolute Healing Technique

We will use a medical bag that can be thrown and has a certain radius of usage, with heavier healing capabilities and limited in quantity.

for a more dynamic regenerative system ill use syringes that can be applied during movement as of rust.

the players will not be allowed to heal other players and there will be no revival system, it will make life more valuable, death will be certain and itll compliment the med pace I am aiming for.

we will use this as a base system to build features upon, perhaps later adding in dynamic cover that may take time to place or be as instant as rust.

its cool to go through this process of research and compare and just cherry pick.

id love to have something more authentic and different but I couldn't perhaps imagine what would suit the game thatd be different from what already exists.

however, I shall leave a link to a form for your input 😊

im trying to use word instead of writing in my book with paper and pen to allow these documents to be public and allow for input from players Aswell.

[form](#)

thnx.
